

CiteGuard — Simple Walkthrough

Very plain language. For anyone on the team who needs to demo without reading the code first.

What is this app?

CiteGuard is a website where you ask questions about company rules (policies). It only answers if the uploaded files actually say that. If it is not sure, it says “I don’t know.” It also shows the exact sentence it used (a citation).

Why we built it

People paste policies into ChatGPT. ChatGPT can sound sure and still be wrong. That is bad for HR and compliance. We want answers you can check.

The three demo clicks (do this live)

1. Open <https://citeguard-two.vercel.app>
2. Click **Paid leave days** → Ask. You should see **18** and citations. Open one citation.
3. Click **Cafeteria pizza (refuse)** → Ask. You should see **I don’t know**. No fake sources.
4. Click **Day 2: superseded policies**. Wait, then look for **22** (not 12). Old policy is marked superseded. New policy is cited.

What “superseded” means (Day 2)

Sometimes a company replaces an old policy with a new one. Example: leave used to be 12 days, now it is 22. CiteGuard must use the **new** one. It should not pretend the old one is still valid. That is the Day 2 twist.

What happens behind the scenes (simple)

1. You upload a policy file (or use the sample).
2. The app cuts the text into small pieces (chunks).
3. When you ask, it finds pieces that match your question.
4. It only keeps pieces from policies that are still current.
5. It builds an answer with quotes — or refuses.
6. An auditor checks: is the quote real? is the file current?
7. It saves a log of the ask (audit).

Words you may hear

Citation — the exact quote and which file it came from.

Refuse — answer “I don’t know” with no citations.

Auditor — code that can block a bad answer before you see it.

policyFamily — which “family” of policy (leave, travel, etc.).

effectiveDate — when that version of the policy started.

Superseded — replaced by a newer version in the same family.

CI — automatic tests on GitHub that must stay green.

If something goes wrong

- Site slow or empty? Refresh once. Try the three buttons again.
- Still broken? Run locally: **npm start** or **docker compose up**.
- Audit CSV empty on Vercel? That can happen across servers. Use local for CSV. Do not start the demo with CSV.

What to open in the GitHub repo (order)

1. **CODEMAP.md** — map of the code
2. **AGENTS.md** — rules we follow
3. **AGENTS_AND_SKILLS.md** — custom agent + skill
4. **DECISIONS.md** → ADR-007 (Day 2)
5. **src/lib/policy-version.ts**
6. **src/lib/faithfulness.ts**
7. GitHub **Actions** (green checks)
8. Release **v0.4.0**

Three short answers to remember

Conflict vs superseded?

Different policy families can disagree (conflict). Same family with an older date is superseded — only the current one is valid.

Why not rebuild everything on Day 2?

We kept retrieve → answer → audit. We added a currency module. That is how we stayed stable.

What did the auditor gain on Day 2?

A quote must be real **and** from the currently effective policy version.

You do not need to sound like an engineer. Click the three buttons. Say: we cite or refuse — and only from the current policy.
